This article aims to evaluate the optimal configuration of a hybrid plant through the total variation complementarity index and the capacity factor, determining the best amounts of each ...

The paper evaluates the potential of solar wind hybrid power generation as a solution to address energy reliability, cost, and environmental sustainability challenges.

The results show that the optimal installed capacity of wind power, photovoltaic power and energy storage is different under different scenarios of renewable energy consumption rate and ...

Behzadi and Sadrizadeh (2023) proposed a multi-energy complementary system of wind-solar-hydrogen to optimize the system capacity configuration, reduce the peak capacity and ...

Abstract: A hybrid renewable energy source (HRES) consists of two or more renewable energy sources, such as wind turbines and photovoltaic systems, utilized together to provide increased system ...

Sensitivity analysis results reveal that the rated speed of wind turbines significantly influences system optimization, while fluctuations in equipment costs within 20 % have a minor effect ...

We optimized the solar system using the conventional Perturb and Observe (P & O) method and the metaheuristic Particle Swarm Optimization (PSO) technique. Our primary objective ...

ia's annual solar energy is equivalent to more than 5000 trillion. This study examined the influence of the following variables on the final decision: batteries and wind turbines, the number of PV panels, the ...

To address this challenge, this article proposes a coupled electricity-carbon market and wind-solar-storage complementary hybrid power generation system model, aiming to maximize ...

Capacity of wind-solar hybrid power generation system

Solar power generation reaches its peak throughout daytime hours but wind power production reaches higher capacity levels during nighttime periods. The combined operation of these power resources ...
