Should a data center battery bank be built?

The proposed data center battery bank also has a lower power rating than most current reference designs, saving some costs. Soft costs like development, engineering, procurement, and construction are a significant portion of installed costs and should decrease with such a large project.

Should data center operators consider off-grid solar & battery systems?

Data center operators are concerned that their rapidly growing electricity demand is outrunning electric utilities' ability to connect and power them. Potential solutions include utility/permitting reform, nuclear, geothermal, and even off-grid solar with batteries. Casey Handmer overviewed off-grid solar + battery systems as a solution on his blog.

How much would a fully equipped data center cost?

Basic estimates for a fully equipped data center building minus the actual computers are around \$10,000/kW. Even 10%-20% savings would substantially impact the relative competitiveness of powering the facility with solar + batteries. Eliminate uninterruptible power supplies.

Will additional storage technologies be added?

Additional storage technologies will be added as representative cost and performance metrics are verified. The interactive figure below presents results on the total installed ESS cost ranges by technology, year, power capacity (MW), and duration (hr).

Off-grid data centers can have different designs than grid-powered ones, creating an opportunity for simplification. Efficiency is also critical because the solar + battery system is expensive.
