How can ports reduce energy costs?

ESSOP has explored two ways in which ports can minimize their energy costs by using energy storage: o Optimising how to use PV solar generation to offset grid electricity. The wholesale price of energy varies every half-hour, and on a time-of-day tariff this variation is passed onto users.

Why is energy storage a critical port function?

Ensuring availability of these electrical resources to meet loads which are intermittent and uncertain is becoming a critical port function. It requires investment in multi-vector energy supply chains, energy storage in ports and their associated energy management systems.

What is the best solution for a port?

The optimal solution for a port depends on multiple factors including: capacity of grid connection and cost of potential expansion of connection capacity; access to in-port renewable energy resources; types of vessel requiring shore power and their duty cycle.
