---

The findings suggest it is possible for the world to wean off polluting sources of power -- even as demand for electricity skyrockets -- with continued investment in renewables including solar, wind, ...

Renewable energy overtook coal as the world's leading source of electricity in the first half of this year - a historic first, according to new data from the global energy think tank Ember.

Solar, wind, hydroelectric, biomass, and geothermal power can provide energy without the planet-warming effects of fossil fuels.

Renewable energy has produced more electricity than coal for the first time, according to a report from energy think tank Ember. Global electricity demand grew by 2.6% in the first half of ...

Renewable energy, usable energy derived from replenishable sources such as the Sun (solar energy), wind (wind power), rivers (hydroelectric power), hot springs (geothermal energy), ...

Renewable energy sources, such as sunlight, water, wind, the heat from the Earth's core, and biomass are natural resources that can be converted into several types of clean, usable energy.

Renewable energy is energy from sources that are naturally replenishing but flow-limited; renewable resources are virtually inexhaustible, but they are limited by the availability of the resources.

The findings suggest it is possible for the world to wean off polluting sources of power -- even as demand for electricity skyrockets -- with continued ...

Renewables, including solar, wind, hydropower, biofuels and others, are at the centre of the transition to less carbon-intensive and more sustainable energy systems. Generation capacity has grown rapidly ...

# Wind electricity solar power and other new energy sources

Renewable energy can meet demand with a much smaller environmental footprint and improve energy security and other issues through distributed and diversified energy infrastructure.
