Our proven fiber-optic load measurement system enables the fast and reliable development of individual pitch control for your turbine, minimizing your investment and time to market.

Two major systems for controlling a wind turbine. Change orientation of the blades to change the aerodynamic forces. With a power electronics converter, have control over generator torque. To ...

You can control a turbine by controlling the generator speed, blade angle adjustment, and rotation of the entire wind turbine. Blade angle adjustment and turbine rotation are also known as ...

In the context of wind energy systems, maintaining optimal power output in wind turbines when wind speeds exceed rated values necessitates precise regulation of blade pitch through the...

At the National Wind Technology Center, researchers design, implement, and test advanced wind turbine controls to maximize energy extraction and reduce structural dynamic loads. ...

When studying the vibration control effect of TMDI [7] on floating offshore wind turbine towers, Sarkar and Fitzgerald simplified the system into a fixed-base single-degree-of-freedom ...

This comparative study aims to identify the most effective control strategy for blade angle regulation in wind turbine systems, potentially improving power extraction efficiency and system ...

Hydraulic pitch control systems are used in various applications, most commonly in wind turbines and aircraft. These systems are designed to control the angle or pitch of rotating blades or ...

This is where pitch control and yaw systems come into play: they precisely control rotor blades and the nacelle and are crucial for energy yield, safety and longevity.

BLADEcontrol® is the pioneer in rotor blade monitoring. The well-known condition monitoring system

Wind turbine blade control system

increases turbine availability, reduces downtimes, and ensures optimal efficiency.
